# 1 Futoshiki (GAC, C++/Python)

## 1.1 Description

Futoshiki is a board-based puzzle game, also known under the name Unequal. It is playable on a square board having a given fixed size ( $4 \times 4$  for example), please see Figure 1.

The purpose of the game is to discover the digits hidden inside the board's cells; each cell is filled with a digit between 1 and the board's size. On each row and column each digit appears exactly once; therefore, when revealed, the digits of the board form a so-called Latin square.

At the beginning of the game some digits might be revealed. The board might also contain some inequalities between the board cells; these inequalities must be respected and can be used as clues in order to discover the remaining hidden digits.

Each puzzle is guaranteed to have a solution and only one.

You can play this game online: <http://www.futoshiki.org/>.

## 1.2 Tasks

1. You should use **GAC** algorithm to implement a Futoshiki solver by **C++** or **Python**.
2. If necessary, you could add some heuristic strategies to speed up your algorithm.
3. You should run the following 5 test cases to verify your solver's **correctness** and **efficiency** in Figure 2, 3, 4, 5, and 6, and I will grade your codes in **GAC implementation, correctness of 5 cases and algorithm efficiency**.
4. Don't forget you have implemented this game by FC algorithm in E04.

## 2 Blocks World (Planner, Prolog)

### 2.1 Description

Planning in the blocks world is a traditional planning exercise, and you can recall what we have introduced in class in Figure 7:

An exercise: blocks world planning

There are a collection of blocks: a block can be on the table, or on top of another block. There are three predicates:

- *clear*(*x*): there is no block on top of block *x*;
- *on*(*x*, *y*): block *x* is on top of block *y*; and
- *onTable*(*x*): block *x* is on the table.

There are three actions:

- *move*(*x*, *y*, *z*): move block *x* from block *y* onto block *z*, provided *x* is on *y*, both *x* and *z* are clear;
- *moveFromTable*(*x*, *y*): move block *x* from the table onto block *y*, provided *x* is on the table, both *x* and *y* are clear; and
- *moveToTable*(*x*, *y*): move block *x* from block *y* onto the table, provided *x* is on *y*, and *x* is clear.

The initial state is: 

a
b
c

      The goal state is: 

a
b

c

Figure 7: Blocks World

Here are several hints for you to develop a blocks world planner **by using Prolog**:

- You can represent the states with **on**(Block, Object) and **clear**(Object). You'd better take into account the location of the blocks, so Object can be a block or a place.
- The only kind of action can be **move**(Block, From, To).
- Each available action is defined in terms of its precondition and its effects. Preconditions can be defined by the procedure **can**(Action, Cond). The effects of an action can be defined by two procedures: **adds**(Action, AddReIs) and **deletes**(Action, DelReIs).
- The planner aims at finding a plan, that is, **a sequence of actions**, which achieves the goal. You can adopt the principle of planning by means-ends analysis illustrated in Figure 8:
- In order to delete unnecessary steps, you can consider avoiding those actions that destroy goals.

Figure 8: The Principle of Means-Ends Planning

## 2.2 Tasks

- Please develop a planner to solve the blocks world problem by using Prolog.
- There are 5 cases (Figure 9, Figure 10, Figure 11, Figure 12 and Figure 13) for you to test the performance of your planner. I will grade your planner in **correctness of cases, the number of steps, and time cost**.
- Adopting breadth-first and best-first heuristic can accelerate the planner, however, you can optimize your planner by using better heuristic functions or other means.

### 3 Notes

- Please send **P02\_Number1\_Number2.zip** to the mailbox ([ai\\_2018@foxmail.com](mailto:ai_2018@foxmail.com)) before the deadline (**2018/10/28 23:59**). The zip file should contain several files: **futoshiki\_gac.cpp** or **futoshiki\_gac.py**, **blocksworld.pl**, **results pictures** and **other necessary files**, such as data files and README.
- Last but not least, you are not alone! If you find yourself stuck on something, contact the TA (QQ: 24747380) for help.
